SGBOX is a modular platform for controlling and managing ICT security. Its modular and distributed architecture means it can adapt to the various company needs. With SGBOX, you can create an aggregate display with all the information gathered from log collection, vulnerability scan and endpoint status. The collected information feeds a correlation engine and analytics system to provide a full network security posture and helps adopt automatic response against cyber security threats.

With its innovative architecture for data management, SGBOX SIEM guarantees high performance in terms of data collection, real-time analysis and historical data. SGBOX, uses less resources than other players, and offers an innovative user experience with unlimited horizontal scalability.

LinkShadow, the next-generation cybersecurity analytics is a dynamic technology platform that helps enhance the productivity of existing security tools as well as provide a host of complementary functions that holistically create a single-pane-of-glass view into the critical challenges faced by organizations. Designed for organizations looking to improve their defense against advanced cyberattacks, LinkShadow empowers security teams to gain maximum insight through multiple features catering to Behavioral Analytics, CXO Visibility, Security Synopsis and Threat Hunting.
Visibility into your entire network is one of the most critical and important yet challenging task. Whether it is a SMB or a large enterprise, there are large number of tools in your IT environment, each of which is generating huge amounts of data in different formats.

SGBOX SIEM Solution is one of the best way of pulling security data from all the data sources and putting it in the same place for analysis and management. It can also filter on the log types and forward only the necessary logs.

**Integration Story: LinkShadow - SGBOX**

LinkShadow integrates with SGBOX to gather the logs from various log sources which are already connected to the SGBOX as part of data collection. SGBOX feeds LinkShadow with the detections of the security devices that are fortifying the enterprise.

LinkShadow collects this intelligence and runs it over the advanced machine learning algorithms in order to build various dashboards to show either the effectiveness and efficiency of the security devices, or the return of investment of the security spend, or to visualize the attackscpe, and more.

**Challenges Overcome by the Integration:**

Visibility into your entire network is one of the most critical and important yet challenging task. Whether it is a SMB or a large enterprise, there are large number of tools in your IT environment, each of which is generating huge amounts of data in different formats.

SGBOX SIEM Solution is one of the best way of pulling security data from all the data sources and putting it in the same place for analysis and management. It can also filter on the log types and forward only the necessary logs.

**Key Benefits:**

- LinkShadow helps build the right scope for the SIEM
- SGBOX is the Single Point of Contact with all Log Sources
- Maximizes collection and investigation efficiency
- Reduces the configuration overheads
- Automates Threat Hunting with Behavioral Analysis
